Preliminary results ...

observations made at station "SP-7". The appearance of auroras at "SP-6" and "SP-7" during the same day with a delay (at "SP-7" 6 to 10 hours later than at "SP-6") which corresponds to the difference of longitudes, is possibly caused by the fact that the intrusion zones of solar corpuscles located on the spiral of settling pass from station "SP-6" to "SP-7" in pace with the Earth rotation. Title : The Influence of Cobalt on the Growth of Young Pigs (Vliyeniye kobal'ta na rost porosyat)

Orig Pub : Sots. tvorinnitstvo, 1957, No 4, 57

Abstract : Three experiments were carried out - in the fall, spring and beginning of summer. In two experiments, all young pigs were given 25 mg. of iron sulfate and 10 mg. of copper sulfate a day. In addition of this, the experimental group was receiving 3 mg. of cobalt sulfate a day (0.5 mg. per 1 kg. of live weight). In the third experiment, the control group was not given trace elements, and the experimental group was receiving cobalt sulfate. In all experiments, the young pigs were administered trace elements from the 10th day to 2 months. All pigs receiving cobalt sulfate had a higher weaning weight by 5.7, 22.1, and 16.1%, as compared with the

TITLE: Magnetic memory element, Class 21, No. 184937

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 16, 1966, 55-56

TOPIC TAGS: magnetic memory element, memory element

ABSTRACT: An Author Certificate has been issued for a magnetic memory element, (see Fig. 1), made with a BIAX-type magnetic conductor, containing recording, answering, and output windings; the answering and output windings are broached in different apertures. To obtain a ternary memory element with nondestructive information readout, an additional winding is used which is passed through the answering aperture. The pulse is sent over this winding before the recording cycle to set the magnetic recording conductor at "zero". Orig. art. has: 1 figure.

Title : Project of Composite Mechanized Conveyer Line for the  
Production of Canned Small Fish in Tomato Sauce

Orig Pub : Ryb. kh-vo, 1956, No 7, 28-35

Abstract : The Gipropishcheprom Institute has prepared a project of a mechanized production line for the manufacture of canned goods designed to perform all operations from intake of the fish up to the forwarding of the finished product to the warehouse. Listed are the machines and apparatus included in the production line. Described are the specific features and advantages of the equipment adopted for the solution of problems involved in the new technology, namely: maintaining the cooked fish for 5 minutes in a sterile medium, filling of hot fish and sauce into

TITLE: Results of the work of the "Inforga-65" Exhibition

SOURCE: Nauchno-tekhnicheskaya informatsiya, no. 11, 1965, 10-14

TOPIC TAGS: data processing system, international organization, computer technology, *data processing conference, information storage and retrieval, computer input unit, recording equipment*

ABSTRACT: The article discusses the results of the "Inforga-65" Exhibition organized in Moscow from 15 May through 30 June 1965 within the framework of the Exhibition of National Economic Achievements by the member-nations of the Council for Mutual Economic Assistance (including Bulgaria, Hungary, GDR, Poland, the Soviet Union, and Czechoslovakia). The exhibition, which dealt with facilities for the mechanization and automation of the preparation and retrieval of scientific and technical information, engineering, control operations, and computation, consisted of the following sections: 1) input systems; 2) specialized systems for the preparation and retrieval of scientific and technical information; 3) equipment for scientific and technical propaganda (projection equipment and sound-recording-and-play-back equipment); 4) library equipment and library operation mechanization facilities; 5) equipment for the mechan-

zation of document compilation, copying and reproduction; 6) instruments, tools, and adaptors for work involving drawings and graphics; and 7) operating control, communication, and signalling equipment. The more important and original developments submitted by the various contributors within these areas are briefly discussed or mentioned. A total of 512 different exhibits were shown, a large number of which were multistage devices and systems, containing as many as 10 and more components. Special certificates were awarded to 133 exhibits. The organization and functioning of the exhibition is seen as an excellent example of cooperation between socialist states.

 TITLE: Method for determining inclination angles of the ocean floor  
 SOURCE: Okeanologiya, v. 6, no. 2, 1966, 367-371  
 TOPIC TAGS: oceanography, ocean floor topography, oceanographic instrument, inclination measurement  
 ABSTRACT: Up to now, inclination angles of the ocean floor have been determined by the tangent of the angle between any two successive depth soundings. The relief profile was approximated by straight lines. Such a method yielded rather approximate angular values, especially considering the errors in measuring the depth and distance between them. It is suggested that bottom relief profiles should be approximated by the second power parabola drawn through five successive points. In the authors' opinion, this method is much more accurate than the previously used approximation by straight lines. The first derivative value is calculated for each of the points. This procedure gives a continuous profile of angles. Use of this method for one profile was presented as an example. Orig. art. has: 2 figures and 6 formulas. [Based on authors' abstract.] [NT]

TITLE: Oceanographic investigations of the Soviet-Cuban marine expedition

SOURCE: Okeanologiya, v. 6, no. 2, 1966, 379-386

TOPIC TAGS: oceanographic ship, oceanographic expedition, biology, ocean floor topography, ocean property

ABSTRACT: This paper discusses results of a joint expedition by the Academies of Sciences of the Soviet Union and of Cuba in 1964-65 to study the marine waters about Cuba and in the Gulf of Mexico. The main objective was a study of biological features, particularly from an economic viewpoint. The studies were made on the Soviet ship Academician A. Kovalevskiy. Participating organisations were the Marine Hydrophysical Institute of UkrSSR (under the direction of V. V. Rossov), the Biological Institute of the South Seas, AN UkrSSR, the Institute of Geological Sciences, AN UkrSSR, the Institute of Oceanography, AN BSSR (under the direction of I. M. Belousov), and the Zoological Institute, AN BSSR. The base of the expedition was the Oceanographic Institute of the Cuban Academy of Sciences. A. Nunez Jimenez,

ACC NR: AP6014290

President of the Cuban Academy of Sciences, D. Gitart, Director of the Institute, and S. Gonzalez, Assistant Director, participated and encouraged the work. The routes taken by the ship are shown on a map. Results have led to improvement of bathymetric charts, better understanding of bottom sediments (the Campeche banks contain chiefly organogenic detritus), and refinement in knowledge of the cause and nature of water circulation and currents and of the distribution of most productive biological zones. Details of biological zones are given. Phytoplankton are most abundant in the southern Gulf of Mexico, and the distribution of zooplankton follows practically the same pattern. Zones of strongly, moderately, and weakly ascending water are plotted on a map. A band of most strongly ascending water lies east-west in Florida Strait. Results of the expedition have been reported at two conferences organized by the Cuban Academy of Sciences: February 1965 and July 1965. Orig. art. has: 3 figures and 1 table.

TITLE: A New Method for the Preparation of Silicon-Magnesium Alloy (Novyy metođ prigotovleniya kremnevomagnsiyevoy ligatury)

PERIODICAL: Liteynoye proizvodstvo, 1958, Nr 8, p 19 (USSR)

ABSTRACT: In the production of cast iron with graphite, metallic magnesium or magnesium alloys are used. The production of magnesium alloys by the usual methods is expensive. In the article, a new method is described in which **ferrosilicon** is melted in a three-electrode electric arc furnace. The method considerably reduces production costs.
